# Let fire be an integral part of our home!

See the Vauni fire experience here!

At the dawn of history our ancestors warmed themselves by the fire, used to cook on the fire and used to tell stories by the fire. During the course of years, we have tamed the flames and brought them into our homes. It does not matter whether we place the Vauni fireplace on the terrace to evoke the atmosphere of the nights by the camp firelight or whether we choose to make it an ornamental piece of our living room, and we enjoy the warmth of the flames on a cold day. Only our imagination puts a limit to its use. Vauni was created by its designers with the aim of providing an innovative and sustainable solution to replace traditional wood-burning fireplaces.

With regard to design, we can think about the wall-mounted Cupola and the sphere-shaped Globe models which can be placed anywhere, the latter is also available with low and high foot.

Vauni reached a milestone in 2023. Swedish designer, photographer, and colour expert Tekla Evelina Severin put a new dress on the organic fireplaces, and created a unique colour collection inspired by nature. So, besides the classic black and white we can also choose from five new designer colours. For the inserts around the burner, you can select between steel inserts in the same colour as the fireplace itself or 100% real mortar in Mystic Graphite and Mystic Sand colour designs.

## Black

## Inspired by the Scandinavian night

Thanks to the dark winter evenings and the cold nights, fireplaces play a special role in people's lives. The Vauni, made among handcrafted circumstances is the combination of top notch Scandinavian aesthetics and technological innovation: it operates in an environmentally friendly manner, smoke-free.

The steel structure of Globe and the aluminium structure of Cupola stands the test of time. With its timeless appearance and outstanding quality, the Vauni fireplace can become our companion for a long time, even if we decide to move.

## White

## Simply neat and modern

Never before has our fireplace at home has been so easy to operate.

Its use is extremely simple, it does not require any preparation or maintenance.

All we have to do is simply fill the fireplace with bioethanol, light the fire, and regulate the size of the flame. And then we can enjoy the warmth the fireplace gives as well as the light of natural fire. Real fire which emanates genuine heat immediately.

## Coral

## Emanates the calmness of the seaside

In its colour it is reminiscent of the atmosphere of coral reefs.

Vauni fireplaces owe their extreme effectiveness thanks to their precisely engineered design, as the heat flows directly into the room, without any loss. Their heating capacity is 2kW which equals the power of an average electric heating device. This results in a pleasant warmth, without making the room over-heated.

## Almond

## Low-key and pleasant to the touch

Vauni endeavours to use the safest solutions on the market. Its bioethanol burners are second to none when it comes to function and safety. Every fireplace comes with a KIWA certificate and an approval of type. Thanks to the caring structural design, the surface of the fireplace can be touched also during operation.

## Sunset

## Taking inspiration from the magic of sunset

Bioethanol operated fireplaces provide the heat in a modern and environmentally friendly way.

The burning process is completely clean during which only a small amount of carbon dioxide and water vapour forms, just like in exhaled air. With Vauni there is no need for a chimney, so it can be placed as a fireplace anywhere we like it, it can even be brought out on the terrace. The Cupola model can be easily installed on a wall of any kind of structure.

## Cobalt

## Makes us take notice

The well thought out concept was brought to life by the unquenchable desire for quality and the feelings created by fire. A Vauni bioethanol operated fireplace does not pollute the air, it makes no harmful emissions. Thanks to clean burning and the production of minimal vapour, those suffering from asthma or allergies do not have to give up on the experience real fire provides.

## Moondust

## The game of shadow and light

As an object of unique design, it is also good to look at when there is no fire burning in it. The sight of the pulsating light of the fireplace is calming, and magicks a homely feel into the space. Thanks to its compact design it can also be fitted into rooms and spaces of smaller size. Whether it is a Cupola or a Globe, a Vauni fireplace tries to take central stage in every interior, this can be further accentuated by opting for a bold colour.

# Technical data

## Globe

Dimensions (widthxheightxdepth) 600x610x580 mm/600x900x580

Weight: from 40 kgs

Heating power: 2kW

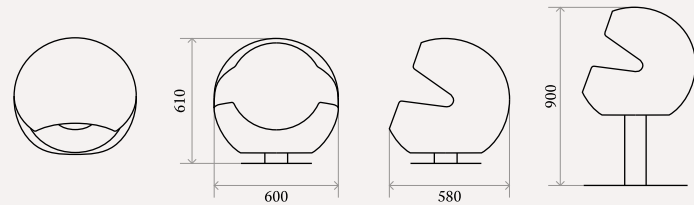

Volume of fuel container: 2 litres

Burning time: a minimum of 5 hours

Fuel consumption: approx. 0.4 litres/hour

Air space size: a minimum of 40 m<sup>3</sup>

Room floor size: a minimum of 17m<sup>2</sup>

## Cupola

Dimensions (diameterxdepth) 810x350mm

Weight: 28 kgs

Heating power: 2kW

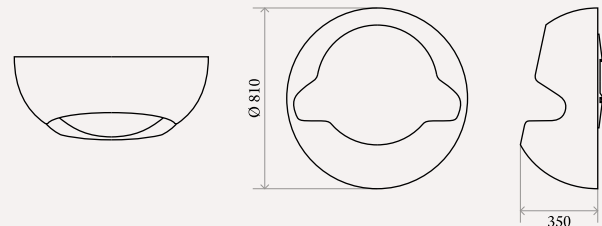

Volume of fuel container: 2 litres

Burning time: a minimum of 5 hours

Fuel consumption: approx. 0.4 litres/hour

Air space size: a minimum of 40 m<sup>3</sup>

Room floor size: a minimum of 17m<sup>2</sup>

## Colours

# What is bioethanol?

Bioethanol is a type of alcohol with a high grade of purity which is produced almost in the same way as are the types of alcohol used in the food industry. Bioethanol made by modern production technologies is mostly made of reused plant waste, or plant crops grown for this purpose, for example corn. After production a difference is made between engine fuel and bioethanol used for fireplaces. Fireplaces operated with bioethanol can only be filled with ethanol used for fireplaces.

When creating NanoHouse Bioethanol we took the following aspects into account:

- to create an optimized and perfect fire-experience for Vauni fireplaces
- to provide all this with a low demand for maintenance and cleaning
- and what is perhaps most important is to burden the environment with the smallest possible footprint during the course of production

NanoHouse Bioethanol comes from local rotational agricultural systems. This Southern Trans-Danubian Bioenergy Farm operates a sustainable system carbon neutrally without the use of fossil energy and it looks upon the produced waste types as sources of energy.

To sum it up, bioethanol is the type of an environment friendly fuel which is obtained from biologically renewing, natural and plant-based energy resources. It burns cleanly, with no dangerous particles getting in the air.
